Iterative scheme	es for the eigenstates				
The it	terative scheme	•			

#### Reminder

We recall here the Schrödinger–Poisson block for the computation of the advection field:

$$-\frac{\hbar^2}{2}\frac{\mathrm{d}}{\mathrm{d}z}\left[\frac{1}{m_{z,\nu}}\frac{\mathrm{d}\psi_{\nu,p}[V]}{\mathrm{d}z}\right] - q\left(V + V_c\right)\psi_{\nu,p}[V] = \epsilon_{\nu,p}[V]\psi_{\nu,p}[V]$$
$$-\mathrm{div}_{x,z}\left[\varepsilon_R\nabla_{x,z}V\right] = -\frac{q}{\varepsilon_0}\left(2\sum_{\nu,p}\varrho_{\nu,p}\left|\psi_{\nu,p}[V]\right|^2 - N_D\right).$$

#### Algorithmically

$$\varrho_{\nu,p}(x) \longrightarrow \text{Schrödinger-Poisson block} \longrightarrow \epsilon_{\nu,p}(x), \ \psi_{\nu,p}(x,z), \ V(x,z).$$

#### Strategy

Using an iterative method: Newton-Raphson or Gummel scheme. This leads to iteratively solving a linear system and an eigenvalue/eigenvector problem.

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work 00	Acknowledgements O
Iterative scheme	es for the eigenstates				
The it	terative scheme	•			

#### Reminder

We recall here the Schrödinger–Poisson block for the computation of the advection field:

$$\begin{split} & \frac{\hbar^2}{2} \frac{\mathrm{d}}{\mathrm{d}z} \left[ \frac{1}{m_{z,\nu}} \frac{\mathrm{d}\psi_{\nu,p}[V]}{\mathrm{d}z} \right] - q \left( V + V_c \right) \psi_{\nu,p}[V] = \epsilon_{\nu,p}[V] \psi_{\nu,p}[V] \\ & -\mathrm{div}_{x,z} \left[ \varepsilon_R \nabla_{x,z} V \right] = -\frac{q}{\varepsilon_0} \left( 2 \sum_{\nu,p} \varrho_{\nu,p} \left| \psi_{\nu,p}[V] \right|^2 - N_D \right). \end{split}$$

#### Algorithmically

$$\varrho_{\nu,p}(x) \longrightarrow \text{Schrödinger-Poisson block} \longrightarrow \epsilon_{\nu,p}(x), \ \psi_{\nu,p}(x,z), \ V(x,z).$$

#### Strategy

Using an iterative method: Newton-Raphson or Gummel scheme. This leads to iteratively solving a linear system and an eigenvalue/eigenvector problem.

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work 00	Acknowledgements O
Iterative scheme	es for the eigenstates				
The it	terative scheme	•			

#### Reminder

CUDA model of p					

### Some remarks on the Cuda implementation

#### **Fine grain**

To be exploited as much as possible: many threads, each of them with a light weight.

#### Shared memory: avoid costly transfer of information

The amount of information being copied between the RAM of the CPU and the GPU should be kept as small as possible. Use of block's shared memory to minimize reads from DRAM or to load data from DRAM in a coalescent manner.

<ロト < 同ト < 回ト < 回ト = 三日 = 三日

#### Exploit warps

Warps are groups of 32 threads. They are physically executed concurrently at hardware level and can exchange information in the fastest way.

- Speedups
- - Surface roughness

• Future work

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work	Acknowledgements O
Schemes' implem	entation on CUDA				
Remin	nder				

Three computational phases:

- selected eigenvalues (usually 6) of  $\sim 1000$  matrices
- their relative eigenvectors
- banded linear system of order  $\sim 4000$

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work 00	Acknowledgements O
Schemes' imple	mentation on CUDA				
The e	igenvalues				

#### **Newton-Raphson**

Iterative method. We give an eigenvalue to each thread. The seeding is by the eigenvalues computed at the previous stage.

The implementation does not use any sophisticated technique worth mentioning.

#### Seeding

In order to converge to the correct eigenvalues, the algorithm must be initialized not too far from the target value. It is therefore used only after the first step, at which the robust bisection algorithm is used, which only requires an interval.

▲□▶▲□▶▲□▶▲□▶ □ のQで

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work	Acknowledgements O
Schemes' implen	nentation on CUDA				
The ei	igenvectors				

#### **IPIM**

The Inverse Power Iterative Method (IPIM) is used.

To approximate eigenvector  $\psi_{\nu,p,i,\cdot}$  we iterate, until a certain tolerance parameter is fulfilled:

▲□▶▲□▶▲□▶▲□▶ □ のQで

• 
$$\psi_{\nu,p,i,\cdot}^{(0)} \in \mathbb{R}^{N_z-2}$$
 is given

• for 
$$k \ge 0$$

• solve 
$$(\mathcal{L}_{\nu,i} - \epsilon_{\nu,p,i}) \psi_{\nu,p,i,\cdot}^{(k+1)} = \psi_{\nu,p,i,i}^{(k)}$$
  
• normalize  $\psi_{\nu,p,i,j}^{(k+1)} \longleftarrow \frac{\psi_{\nu,p,i,j}^{(k+1)}}{\left\|\psi_{\nu,p,i,\cdot}^{(k+1)}\right\|}$ 

#### The linear system

In order to solve the linear system, Thomas algorithm is used.

	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work	Acknowledgements O
Schemes' implemen	ntation on CUDA				
Updati	ng potential				

#### Jacobi scheme

Jacobi iterative algorithm is very parallel but also particularly inefficient.

#### **Relaxed Jacobi scheme**

Suppose we are solving (for the sake of lighter notations) linear system A x = b. If we decompose matrix A as L + D + U, the relaxed Jacobi iteration of parameter  $\omega > 0$  reads

$$\mathcal{L}_{\omega} \mathbf{x} := \mathbf{M}_{\omega}^{-1} \mathbf{N}_{\omega} \mathbf{x} + \mathbf{M}_{\omega}^{-1} \mathbf{b}.$$

where

$$M_{\omega} := \frac{1}{\omega} D, \qquad N_{\omega} := \frac{1-\omega}{\omega} D - L - U.$$

▲□▶▲□▶▲□▶▲□▶ □ のQで

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work	Acknowledgements O
Schemes' imple	mentation on CUDA				
Upda	ting potential				

#### Scheduled-Relaxation Jacobi (SRJ) scheme

The SRJ consists in defining sequences of relaxed Jacobi steps:

and updating the guess for the solution of system  $A \cdot x = b$  using these:

$$\boldsymbol{x}^{(\ell+1)} = \mathcal{L}\boldsymbol{x}^{(\ell)}.$$

#### Avoiding rounding errors

In practice, we do not use  $\omega_{\ell}$  consecutive steps with parameter  $q_{\ell}$ . Rather, we "shuffle" the relaxation steps, to avoid **rounding errors**. The way they follow each other is of fundamental relevance for the stability.

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness	Future work 00	Acknowledgements O
Schemes' implem	nentation on CUDA				
Updat	ing potential				

#### Avoiding rounding errors

For example, the following sequence proves stable

387.38, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 14.127, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, .53448, 38.971, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 5.1286, 0.53448, 0.87254, 102.42, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 14.127, 0.87254, 0.53448, 1.9628, 1.9628, 0.53448, 5.1286, 0.53448, 5.1286, 0.53448, 1.9628, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 233.47, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 0.87254, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 1.9628, 0.53448, 38.971, 0.53448, 0.87254, 1.9628, 0.53448, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 1.9628, 0.53448, 1.9628, 5.1286, 0.53448, 0.87254, 1.9628, 0.53448, 0.87254, 0.53448, 0.87254, 0.53448, 0.87254, 0.53448, 0.87254, 0.53448, 0.87254, 0.53448

while, if we choose an unsuitable order, the magnitude of the solution vector may explode and contract even by 14-15 orders, hence leading to rounding errors.

Surface roughne	:55				
Surfa	ce roughness				

The real  $Si/SiO_2$  interface is not smooth. This affects the properties of the transistor. The impact of the surface roughness is described as an additional scattering phenomenon.

▲□▶▲□▶▲□▶▲□▶ □ のQで

Scatte	ering operator				

The usual structure of the scattering operator

$$\mathcal{Q}_{\nu,p}[f] = \int_{\mathbb{R}^2} \left[ S_{(\nu,p,k') \to (\nu,p,k)} f_{\nu,p}(k') - S_{(\nu,p,k) \to (\nu,p,k')} f_{\nu,p}(k) \right] \, \mathrm{d}k'.$$

The scattering rates are

$$S_{\boldsymbol{k} \to \boldsymbol{k'}} = K^{\text{upp}} \cdot \frac{\mathcal{I}_{\nu,p}^{\text{upp}} \cdot \delta\left(\epsilon_{\nu,p}^{\text{tot}}(\boldsymbol{k}) - \epsilon_{\nu,p}^{\text{tot}}(\boldsymbol{k'})\right)}{\left(1 + \frac{|\boldsymbol{k} - \boldsymbol{k'}|^2}{2}\right)^{3/2}} + K^{\text{low}} \cdot \frac{\mathcal{I}_{\nu,p}^{\text{low}} \cdot \delta\left(\epsilon_{\nu,p}^{\text{tot}}(\boldsymbol{k}) - \epsilon_{\nu,p}^{\text{tot}}(\boldsymbol{k'})\right)}{\left(1 + \frac{|\boldsymbol{k} - \boldsymbol{k'}|^2}{2}\right)^{3/2}}.$$

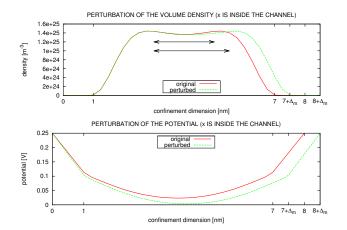

The overlap integral is replaced by a first-order approximation for the electric field's perturbation:

$$\mathcal{I}^{\mathrm{upp}}_{(\nu,p)}(x) = \left| \int_{0}^{L_{z}} \left| \psi_{\nu,p}(x,z) \right|^{2} \frac{\Delta V^{\mathrm{upp}}(x,z)}{\Delta^{\mathrm{upp}}_{\mathrm{m}}} \mathrm{\,d}z \right|^{2}$$

The integrator performs several computational phases:

(i). It stretches by interpolation the total volume density onto the extended domain  $\check{z}$ 

$$\check{N}_{i,\check{\jmath}} = \operatorname{li}\left[N_{i,\cdot}\right]\left(S^{-1}(\check{z}_{\check{\jmath}})\right).$$

(ii). It solves on  $\check{z}$  the Poisson equation  $(D\check{V})_{i,\check{j}} = -C_p (\check{N}_{i,\check{j}} - (\check{N}_D)_{i,\check{j}}).$ 

(iii). It interpolates  $(\Delta V^{\text{upp}})_{i,j} = V_{i,j} - \text{LI}\left[\left(\check{V}\right)_{i,\cdot}\right](z_j)$ , then  $\left(\Delta V^{\text{low}}\right)_{i,j} = V_{i,j} - \text{LI}\left[\left(\check{V}\right)_{i,\cdot}\right]\left(z_j + \frac{\Delta_{\text{m}}}{L_z}\right).$ 

(iv). It integrates

$$\mathcal{I}_{\nu,p,i} = \underbrace{\left(\Delta z \sum_{j=1}^{N_z - 2} (\psi_{\nu,p,i,j})^2 \, \Delta V_{i,j}^{\text{upp}}\right)^2}_{\mathcal{I}_{\nu,p,i}^{\text{upp}}} + \underbrace{\left(\Delta z \sum_{j=1}^{N_z - 2} (\psi_{\nu,p,i,j})^2 \, \Delta V_{i,j}^{\text{low}}\right)^2}_{\mathcal{I}_{\nu,p,i}^{\text{low}}}.$$

The model	Numerical schemes	Experiments 000	Work in progress: surface roughness 000000€0	Future work 00	Acknowledgements O
Surface roughne	ess				
Scatte	ering operator				

(v). It computes the gain and loss parts of the scattering operator:

$$\mathcal{Q}_{\nu,p,i,\ell,m}^{\mathrm{SR,gain}} = \mathcal{C} \, \mathcal{I}_{\nu,p,i} \, s_{\nu,\ell} \, \Delta \phi \, \sum_{m'=0}^{N_{\phi-1}} \Phi_{\nu,p,i,\ell,m'} \, \mathcal{D}_{\nu,\ell,m,m'} \tag{1}$$

$$\mathcal{Q}_{\nu,p,i,\ell,m}^{\mathrm{SR,loss}} = \mathcal{C} \, \mathcal{I}_{\nu,p,i} \, s_{\nu,\ell} \, \Phi_{\nu,p,i,\ell,m} \, \widetilde{\mathcal{D}}_{\nu,\ell,m}. \tag{2}$$

where

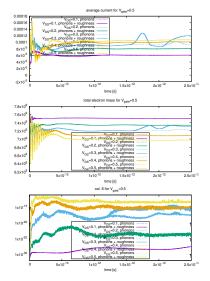

$$\mathcal{D}_{\nu,\ell,m,m'} = \left(1 + 4(k^*)^2 \lambda_m^2 w_\ell (1 + \alpha_\nu \epsilon^* w_\ell) \sin^2 \left(\frac{\phi_m - \phi_{m'}}{2}\right) \times \left[m_{x,\nu} \sin^2 \left(\frac{\phi_m + \phi_{m'}}{2}\right) + m_{y,\nu} \cos^2 \left(\frac{\phi_m + \phi_{m'}}{2}\right)\right]\right)^{-3/2}$$
(3)

$$\widetilde{\mathcal{D}}_{\nu,\ell,m} = \Delta \phi \sum_{m'=0}^{N_{\phi}-1} \mathcal{D}_{\nu,\ell,m,m'}.$$
(4)
